

Case Study

Real-time solutions for efficient operations in the oil and gas industry

Opportunity

Wellsite Report is a digital platform that unifies and modernizes the communication between the many stakeholders involved in well site completion. For years, the oil and gas industry relied heavily on paper-based and disjointed systems that hurt the bottom line and negatively impacted operational efficiency. Rivers Agile was hired to design and build a high-tech, real-time solution to the existing piecemeal process.

Solution

DigitOil and Rivers Agile partnered to increase efficiency and transparency in the drilling process by combining incident and job data into one app for better sales, safety and efficiency. Users are able to:

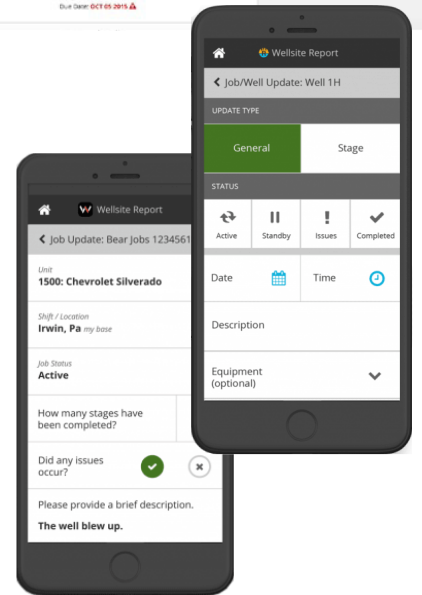

- Create consistent reports and processes
- See reliable, real-time data from the well site
- Report incidents in the field
- Understand well site operations from the office

Value

Wellsite Report converges multiple projects, vendors and datasets into one place. With the fully mobile website and app, operators and contractors can easily communicate and track information directly from the well site. Version 1.0 of Wellsite Report was released to consumers in 2016 and is actively being used by several organizations.

Benefits include:

- Easy reporting and tracking of information directly from the well site, while notifications on job statuses, delays and issues are in real time
- Monitor and analyze data, and establish preventative measures based on newly available data and observations
- Streamlined procedures and workflows provide a central workspace for communication

Client
DigitOil

Location
Pittsburgh, PA

Industry
Oil and Gas

Project Scope
Product Strategy, UX Design, UI Design, Software Development, QA and Testing
